

Incident Response Report

NetSupport RAT Infection – Network Traffic Analysis

Incident Date: Tuesday, 26 November 2024 **Initial Observed Activity:** Approximately 04:50 UTC

Evidence Source: 2024-11-26-traffic-analysis-exercise.pcap

Analysis Tool: Wireshark / PCAP network traffic analysis

1. Executive Summary

On Tuesday, **26 November 2024**, a Windows workstation at IP address **10.11.26.183** exhibited network activity consistent with a **NetSupport RAT infection**. The captured traffic shows the workstation accessing **classicgrand.com** shortly before accessing **modandcrackedapk.com**. The latter domain resolved to **193.42.38.139**, and the workstation established TLS connections to that address using the SNI **modandcrackedapk.com**.

Shortly afterward, beginning at approximately **04:50:45 UTC**, the workstation established repeated communications with **194.180.191.64 over TCP/443**. The traffic contains an HTTP POST request to **/fakeurl.htm** with the User-Agent **NetSupport Manager/1.3**. The remote server responded with **NetSupport Gateway/1.8 (Windows NT)**. These characteristics provide strong network evidence of communication with NetSupport RAT infrastructure.

The PCAP therefore supports the conclusion that the workstation was compromised and subsequently communicated with NetSupport RAT infrastructure. The observed sequence is consistent with a fake-update/social-engineering delivery chain involving **modandcrackedapk.com**, with **classicgrand.com** occurring immediately before the suspicious domain. The PCAP alone cannot prove that classicgrand.com directly delivered the malware.

2. Victim / Affected Host Details

Field	Value
Victim Name	Oliver Q. Boomwald
IP Address	10.11.26.183
Host Name	DESKTOP-B8TQK49
MAC Address	d0:57:7b:ce:fc:8b
Windows User Account	oboomwald
Operating System	Windows
Suspected Malware	NetSupport RAT
Incident Category	Malware / RAT / Fake Update

3. Indicators of Compromise (IOCs)

IOC Type	Indicator	Assessment
Victim IP	10.11.26.183	Compromised host
Hostname	DESKTOP-B8TQK49	Victim workstation
MAC	d0:57:7b:ce:fc:8b	Victim workstation
User	oboomwald	Logged-in Windows account
Suspicious Domain	modandcrackedapk.com	High-priority IOC
Suspicious IP	193.42.38.139	Associated with suspicious domain in PCAP
RAT C2	194.180.191.64:443	High-priority IOC
RAT URI	/fakeurl.htm	NetSupport communication

IOC Type	Indicator	Assessment
User-Agent	NetSupport Manager/1.3	NetSupport indicator
Server	NetSupport Gateway/1.8 (Windows NT)	NetSupport indicator
Suspected Website	classicgrand.com	Potential infection-chain component

4. Important IOC Correction

The originally supplied IOC listed **194.180.191.164**. Analysis of the supplied PCAP found the NetSupport traffic communicating with **194.180.191.64**, not .164. The PCAP contains **132 occurrences** of **194.180.191.64** and **0 occurrences** of **194.180.191.164**. Therefore, the verified NetSupport destination for this PCAP is **194.180.191.64:443**.

5. Technical Evidence

Observed NetSupport HTTP request:

```
POST http://194.180.191.64/fakeurl.htm HTTP/1.1
User-Agent: NetSupport Manager/1.3
Content-Type: application/x-www-form-urlencoded
Host: 194.180.191.64
```

The request contains parameters including **CMD=ENCD**, **ES=1**, and encoded DATA. The server later responds with:

```
HTTP/1.1 200 OK
Server: NetSupport Gateway/1.8 (Windows NT)
Content-Type: application/x-www-form-urlencoded
```

The combination of the NetSupport Manager User-Agent, NetSupport Gateway server identification, /fakeurl.htm URI, and repeated communications is strong evidence of NetSupport RAT activity.

6. Suspicious Domain Activity

At approximately **04:50:11 UTC**, the victim generated DNS activity involving **classicgrand.com**. Approximately three seconds later, at **04:50:14 UTC**, the workstation generated DNS activity involving **modandcrackedapk.com**. The PCAP subsequently shows TLS traffic to **193.42.38.139:443** with SNI **modandcrackedapk.com**.

7. Timeline of Observed Events

Time (UTC)	Event	Evidence
04:49:38	Hostname DESKTOP-B8TQK49 observed	PCAP
04:49:55	Windows account oboomwald observed	PCAP
04:50:11	DNS activity for classicgrand.com	PCAP
04:50:14	DNS activity for modandcrackedapk.com	PCAP
04:50:14	TLS connection using SNI modandcrackedapk.com to 193.42.38.139:443	PCAP
04:50:45	NetSupport HTTP communication begins	PCAP
04:50:45	POST request to /fakeurl.htm	PCAP
04:50 onward	Repeated NetSupport communications to 194.180.191.64:443	PCAP
05:40:28	NetSupport polling communication observed	PCAP
05:40:29	NetSupport Gateway responds with HTTP 200	PCAP

8. Infection Chain Assessment

Windows Client (10.11.26.183) → classicgrand.com → modandcrackedapk.com (193.42.38.139) → NetSupport RAT → 194.180.191.64:443 → /fakeurl.htm

The traffic sequence is consistent with a fake-update malware delivery scenario. The PCAP alone cannot prove every step of the delivery mechanism; additional browser, endpoint, proxy, or forensic evidence would be required to establish exactly how the executable was delivered and executed.

9. Assessment of Compromise

Finding: COMPROMISED

Confidence: High

- The Windows host generated traffic associated with modandcrackedapk.com.
- The host established TLS communication to 193.42.38.139 using modandcrackedapk.com as the SNI.
- The same host communicated with 194.180.191.64:443 shortly afterward.
- The traffic used the User-Agent NetSupport Manager/1.3.
- The remote server identified itself as NetSupport Gateway/1.8 (Windows NT).
- The client repeatedly sent POST requests to /fakeurl.htm.
- The communications continued periodically, consistent with persistent RAT/C2 activity.

10. Recommended Incident Response Actions

Immediate Containment

- Isolate 10.11.26.183 from the network.
- Block outbound communication to 194.180.191.64 and 193.42.38.139.
- Block or monitor modandcrackedapk.com and classicgrand.com according to organizational procedures.
- Preserve the affected host before destructive remediation.
- Capture volatile memory if forensic procedures permit.

Endpoint Investigation

- Search for NetSupport installation files and recently downloaded executables.
- Review browser download and browsing history.
- Investigate Scheduled Tasks, Services, Startup entries, and Registry Run/RunOnce keys.
- Review Windows Event Logs, Prefetch, and the affected user profile.
- Search for persistence mechanisms.

Network Investigation

- Search organizational logs for 194.180.191.64, 193.42.38.139, modandcrackedapk.com, classicgrand.com, /fakeurl.htm, and NetSupport Manager/1.3.
- Determine whether other internal hosts contacted the same infrastructure.

Credential Protection

- Treat credentials used on the affected workstation as potentially exposed.
- Consider password resets and session/token revocation according to the organization's incident-response procedures.

11. Limitations

This report is based primarily on the supplied network capture. The PCAP provides strong evidence for the affected workstation, hostname and account, communication with modandcrackedapk.com, communication with 194.180.191.64, NetSupport-specific HTTP characteristics, and the timing of the observed communications.

The PCAP alone does not prove who operated the RAT, the exact malware executable downloaded, the exact execution time, that classicgrand.com directly delivered the malware, what commands were executed, or what files/credentials may have been accessed. Those findings require additional endpoint, browser, authentication, proxy, DNS, or forensic evidence.

12. Final Conclusion

The network capture provides **high-confidence evidence that Windows workstation 10.11.26.183 was communicating with NetSupport RAT infrastructure**. The strongest evidence is repeated communication with **194.180.191.64:443** using **POST /fakeurl.htm**, the User-Agent **NetSupport Manager/1.3**, and the server identification **NetSupport Gateway/1.8 (Windows NT)**.

The workstation also accessed **modandcrackedapk.com** shortly before the NetSupport communication began. **classicgrand.com** appears immediately before the suspicious domain in the observed DNS timeline and should therefore be investigated as a possible component of the infection chain.

Primary confirmed RAT IOC: 194.180.191.64:443

Primary suspicious domain: modandcrackedapk.com

Likely related website: classicgrand.com

Affected host: 10.11.26.183 / DESKTOP-B8TQK49

Affected account: oboomwald

Evidence Source: 2024-11-26-traffic-analysis-exercise.pcap

Note: IOC values in this report are based on the supplied PCAP and should be independently validated against endpoint and threat-intelligence sources before production blocking.
